

Elsag Datamat is the centre of excellence in the design and production of systems, services and solutions for automation, security, transport, defence & space, and information technology. Building on the integration of Elsag and Datamat in 2007, Elsag Datamat forms part of the Finmeccanica group, one of the world's leading industrial players.

Elsag Datamat devises, designs and develops high technology products, systems and solutions that stand out for excellent performance and reliability. The offering in automation, security, transport, defence & space and information technology draws on expertise acquired in major projects of vital importance for "system Italy". Against this backdrop, information technology represents both a specific offering and an empowering infrastructure in other strategic areas. The professional skills of 3,800 employees, technology, know-how, the capacity to operate in critical contexts, and an innovative approach demonstrated by constant investment in research and development, are just some of the distinctive features developed over more than a century in business.

#### Security

Elsag Datamat is the Italian centre of excellence for physical, logical and communication network security. One of the first businesses in Italy to receive ISO 27001 certification in certain specific areas, the company's securbusiness® approach offers comprehensive, integrated solutions to secure critical national, territorial, border and network communications. The Elsag Datamat hardware and software R&D centres liaise with universities and scientific institutes to develop advanced technology systems using both proprietary and third party products. Consulting, product development, system integration, service and certification management, but also networking and network security, plus identity and access control based on biometric technology and systems to deliver telecare, telemonitoring and telerescue services: these are just some examples of the technology skills mastered by Elsag Datamat in the security arena. Several thousand Elsag Datamat mobile and roadside licence plate reading systems have been installed in Italy and throughout the world.

#### Defence and Space

Elsag Datamat has a heritage of experience in this sector, building complex systems for Italian and international programmes, as members of leading industrial consortia or on a joint basis with the Italian Ministry of Defence, Space Agencies and the European Commission. Elsag Datamat works in all defence sectors in which information technology is a strategic, empowering factor: command and control, mission planning, logistics, simulation and training. The Company's experience in the space sector covers many application areas: control centres, onboard satellite navigation software, ground segment systems for the acquisition, processing and storage of earth observation data, and Multi-Mission User Services providing access to a series of mission catalogues. Elsag Datamat has also implemented emergency management, environmental monitoring and meteorology systems, in a sector featuring growing similarity between the methods used to manage military and civilian crisis situations, with the same technology increasingly used in a dual role.
